Chapter 1

Introduction

This paper discusses two security measurements, namely Link Layer Security (LLSEC) and Datagram TLS (DTLS), within Contiki OS.

1.1 Related Work

[1] discusses some security concerns in 802.15.4. LLSEC[2] is the implementation of 802.15.4 security in Contiki.

tinydtls[3] is the implementation of DTLS we used in DTLS related experiments.

1.2 Experiment Setup

All experiments are done within the Cooja simulator.

The setup is as described in Figure 1.1.

- **Adversary** is the malicious party that tries to recover information from the encrypted traffic.
- **Border Router**, or BR, is a device that connects the adversary to the sensor network. However, this is only allowed when LLSEC is disabled.
- **Sniffer** is a device that passively captures all traffics in the sensor network.
- **Target** and **Nodes** are sensors deployed in the sensor network. They communicates to each other through encrypted channels.

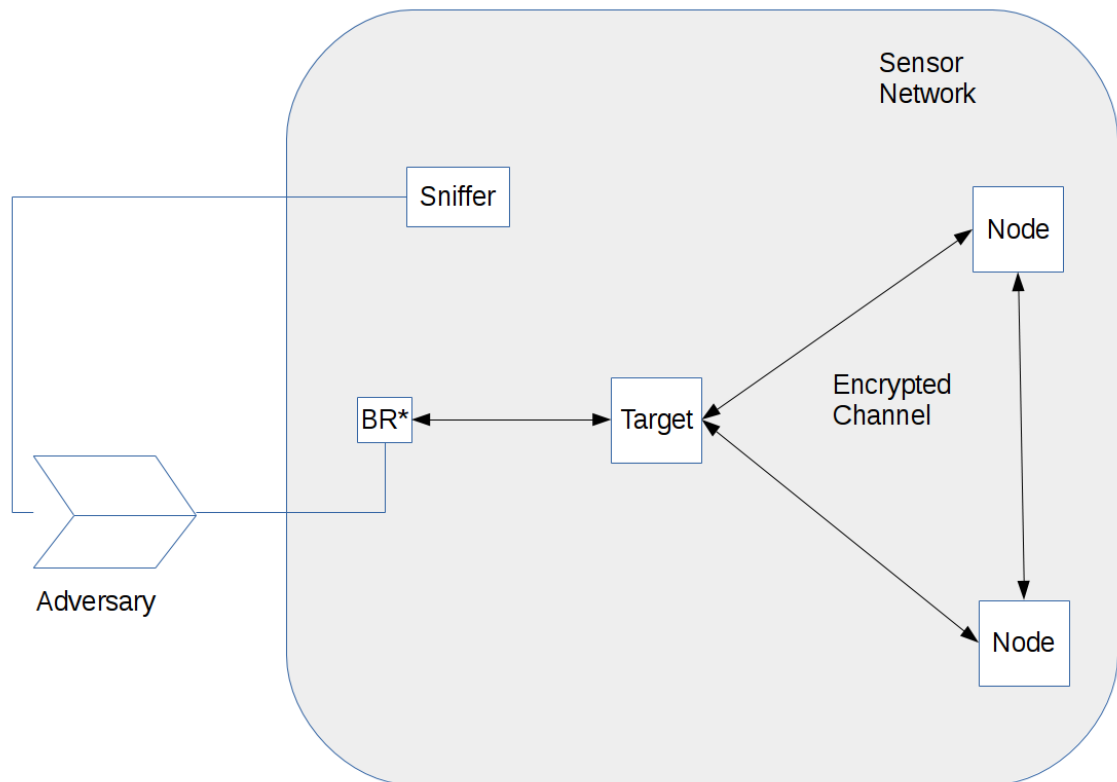

Figure 1.1: Experiment setup

Chapter 2

Link Layer Security

2.1 Non core security

2.2 802.15.4 security

2.3 Reset Problem

2.4 Distinctive packet length for RPL packets

Chapter 3

DTLS

3.1 Conflicting MTU between DTLS and 6lowPAN

The abandoned CoDTLS.

3.2 Overloading DTLS with LLSEC

Chapter 4

Application Detection

4.1 Packet Length

4.2 Response Time

4.3 Pingload: Ping side-channel for Payload
